I claim:

1. A method implemented by a supporting switch for providing Internet Protocol, IP, telephone set subscribers with call features comprising the steps of:

5

receiving at an IP peripheral unit, IPPU, a first IP packet containing a request for a first call feature;

10

transmitting a second message from the IPPU to a packet line trunk unit of a switch module where the second message contains the request for the first call feature;

accessing first information contained in a directory database by an applications processor based on the request for the first call feature contained in the second message;

15 th

the applications processor retrieving at least a portion of said first information;

transmitting said at least portion of the first information to an IP telephone set subscriber in response to the request for the first call feature.

20

- 2. The method according to claim 1 wherein said at least portion of the first information is transmitted to the IP telephone set subscriber that made the request for the first call feature.
- 3. The method according to claim 1 wherein said request for the first call feature is from a calling party, and said at least portion of the first information is transmitted to a called IP telephone set subscriber.
- 4. The method according to claim 1 wherein the transmitting of the second message comprises transmitting a second message that is compatible with peripheral control and timing facilities interface protocol.

30

25

5. The method according to claim 1 wherein the first call feature is one of a group including calling name display and directory query display.

- 6. A method implemented by a supporting switch for providing Internet Protocol, IP, telephone set subscribers with call features comprising the steps of:
- receiving at an IP peripheral unit, IPPU, a first IP packet containing a request for a first call feature;
 - transmitting a message based on the request for the first call feature to an applications processor;
- locating first information contained in a directory database by the applications processor based on the request for the first call feature;
 - the applications processor retrieving at least a portion of said first information;

20

- transmitting said at least portion of the first information to an IP telephone set subscriber in response to the request for the first call feature.
 - 7. The method according to claim 6 wherein said at least portion of the first information is transmitted to the IP telephone set subscriber that made the request for the first call feature.
 - 8. The method according to claim 6 wherein said request for the first call feature is from a calling party, and said at least portion of the first information is transmitted to a called IP telephone set subscriber.
- 9. The method according to claim 6 wherein the transmitting of the message comprises transmitting a message that is compatible with peripheral control and timing facilities interface protocol.
- 10. The method according to claim 6 wherein the first call feature is one of a group30 including calling name display and directory query display.
